## The constructions of general connections on second jet prolongation

ABSTRACT. We determine all natural operators  $D$  transforming general connections  $\Gamma$  on fibred manifolds  $Y \rightarrow M$  and torsion free classical linear connections  $\nabla$  on  $M$  into general connections  $D(\Gamma, \nabla)$  on the second order jet prolongation  $J^2Y \rightarrow M$  of  $Y \rightarrow M$ .

**1. Introduction.** The concept of  $r$ -th order connections was firstly introduced on groupoids by C. Ehresmann in [2] and next by I. Kolář in [3] for arbitrary fibred manifolds.

Let us recall that an  $r$ -th order connection on a fibred manifold  $p: Y \rightarrow M$  is a section  $\Theta: Y \rightarrow J^rY$  of the  $r$ -jet prolongation  $\beta: J^rY \rightarrow Y$  of  $p: Y \rightarrow M$ . A general connection on  $p: Y \rightarrow M$  is a first order connection  $\Gamma: Y \rightarrow J^1Y$  or (equivalently) a lifting map

$$\Gamma: Y \times_M TM \rightarrow TY.$$

By  $\text{Con}(Y \rightarrow M)$  we denote the set of all general connections on a fibred manifold  $p: Y \rightarrow M$ .

If  $p: Y \rightarrow M$  is a vector bundle and an  $r$ -th order connection  $\Theta: Y \rightarrow J^rY$  is a vector bundle morphism, then  $\Theta$  is called an  $r$ -th order linear connection on  $p: Y \rightarrow M$ .

*Key words and phrases.* General connection, classical linear connection, higher order jet prolongation, bundle functor, natural operator.

An  $r$ -th order linear connection on  $M$  is an  $r$ -th order linear connection  $\Lambda: TM \rightarrow J^r TM$  on the tangent bundle  $\pi_M: TM \rightarrow M$  of  $M$ . By  $Q^r(M)$  we denote the set of all  $r$ -th order linear connections on  $M$ .

A classical linear connection on  $M$  is a first order linear connection  $\nabla: TM \rightarrow J^1 TM$  or (equivalently) a covariant derivative  $\nabla: \mathfrak{X}(M) \times \mathfrak{X}(M) \rightarrow \mathfrak{X}(M)$ . A classical linear connection  $\nabla$  on  $M$  is called torsion free if its torsion tensor  $T(X, Y) = \nabla_X Y - \nabla_Y X - [X, Y]$  is equal to zero. By  $Q_\tau(M)$  we denote the set of all torsion free classical linear connections on  $M$ .

Let  $\mathcal{FM}$  denote the category of fibred manifolds and their fibred maps and let  $\mathcal{FM}_{m,n} \subset \mathcal{FM}$  be the (sub)category of fibred manifolds with  $m$ -dimensional bases and  $n$ -dimensional fibres and their local fibred diffeomorphisms. Let  $\mathcal{M}f_m$  denote the category of  $m$ -dimensional manifolds and their local diffeomorphisms. Let  $F: \mathcal{FM}_{m,n} \rightarrow \mathcal{FM}$  be a bundle functor on  $\mathcal{FM}_{m,n}$  of order  $r$  in the sense of [4]. Let  $\Gamma: Y \times_M TM \rightarrow TY$  be the lifting map of a general connection on an object  $p: Y \rightarrow M$  of  $\mathcal{FM}_{m,n}$ . Let  $\Lambda: TM \rightarrow J^r TM$  be an  $r$ -th order linear connection on  $M$ . The flow operator  $\mathcal{F}$  of  $F$  transforming projectable vector fields  $\eta$  on  $p: Y \rightarrow M$  into vector fields  $\mathcal{F}\eta := \frac{\partial}{\partial t}|_{t=0} F(Fl_t^\eta)$  on  $FY$  is of order  $r$ . In other words, the value  $\mathcal{F}\eta(u)$  at every  $u \in F_y Y, y \in Y$  depends only on  $j_y^r \eta$ . Therefore, we have the corresponding flow morphism  $\tilde{\mathcal{F}}: FY \times_Y J^r TY \rightarrow T FY$ , which is linear with respect to  $J^r TY$ . Moreover,  $\tilde{\mathcal{F}}(u, j_y^r \eta) = \mathcal{F}\eta(u)$ , where  $u \in F_y Y, y \in Y$ . Let  $X^\Gamma$  be the  $\Gamma$ -lift of a vector field  $X$  on  $M$  to  $Y$ , i.e.  $X^\Gamma$  is a projectable vector field on  $p: Y \rightarrow M$  defined by  $X^\Gamma(y) = \Gamma(y, X(x)), y \in Y_x, x = p(y) \in M$ . Then the connection  $\Gamma$  can be extended to a morphism  $\tilde{\Gamma}: Y \times_M J^r TM \rightarrow J^r TY$  by the following formula  $\tilde{\Gamma}(y, j_x^r X) = j_y^r(X^\Gamma)$ . By applying  $\mathcal{F}$ , we obtain a map  $\mathcal{F}(\tilde{\Gamma}): FY \times_M J^r TM \rightarrow T FY$  defined by  $\mathcal{F}(\tilde{\Gamma})(u, j_x^r X) = \tilde{\mathcal{F}}(u, j_y^r(X^\Gamma)) = \mathcal{F}X^\Gamma(u)$ . Further the composition

$$\mathcal{F}(\Gamma, \Lambda) := \mathcal{F}(\tilde{\Gamma}) \circ (id_{FY} \times \Lambda): FY \times_M TM \rightarrow T FY$$

is the lifting map of a general connection on  $FY \rightarrow M$ . The connection  $\mathcal{F}(\Gamma, \Lambda)$  is called  $F$ -prolongation of  $\Gamma$  with respect to  $\Lambda$  and was discovered by I. Kolář [5].

Let  $\nabla$  be a torsion free classical linear connection on  $M$ . For every  $x \in M$ , the connection  $\nabla$  determines the exponential map  $exp_x^\nabla: T_x M \rightarrow M$  (of  $\nabla$  in  $x$ ), which is diffeomorphism of some neighbourhood of the zero vector at  $x$  onto some neighbourhood of  $x$ . Every vector  $v \in T_x M$  can be extended to a vector field  $\tilde{v}$  on a vector space  $T_x M$  by  $\tilde{v}(w) = \frac{\partial}{\partial t}|_{t=0} [w + tv]$ . Then we can construct an  $r$ -th order linear connection  $E_r(\nabla): TM \rightarrow J^r TM$ , which is given by  $E_r(\nabla)(v) = j_x^r((exp_x^\nabla)_* \tilde{v})$ . This connection is called an exponential extension of  $\nabla$  and was presented by W. Mikulski in [9]. Another equivalent definition (for corresponding principal connections in the  $r$ -frame bundles)

of the exponential extension was independently introduced by I. Kolář in [6]. Hence given a general connection  $\Gamma$  on  $Y \rightarrow M$  and a torsion free classical linear connection  $\nabla$  on  $M$ , we have the general connection

$$\mathcal{F}(\Gamma, \nabla) := \mathcal{F}(\Gamma, E_r(\nabla)): FY \times_M TM \rightarrow T FY.$$

The canonical character of construction of this connection can be described by means of the concept of natural operators. The general concept of natural operators can be found in [4]. In particular, we have the following definitions.

**Definition 1.** Let  $F: \mathcal{FM}_{m,n} \rightarrow \mathcal{FM}$  be a bundle functor of order  $r$  on a category  $\mathcal{FM}_{m,n}$ . An  $\mathcal{FM}_{m,n}$ -natural operator  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(F \rightarrow \mathcal{B})$  transforming general connections  $\Gamma$  on fibred manifolds  $p: Y \rightarrow M$  and torsion free classical linear connections  $\nabla$  on  $M$  into general connections  $D(\Gamma, \nabla): FY \rightarrow J^1 FY$  on  $FY \rightarrow M$  is a system of regular operators  $D_Y: \text{Con}(Y \rightarrow M) \times Q_\tau(M) \rightarrow \text{Con}(FY \rightarrow M)$ , ( $p: Y \rightarrow M$ )  $\in \text{Obj}(\mathcal{FM}_{m,n})$  satisfying the  $\mathcal{FM}_{m,n}$ -invariance condition: for any  $\Gamma \in \text{Con}(Y \rightarrow M)$ ,  $\Gamma_1 \in \text{Con}(Y_1 \rightarrow M_1)$ ,  $\nabla \in Q_\tau(M)$  and  $\nabla_1 \in Q_\tau(M_1)$  such that if  $\Gamma$  is  $f$ -related to  $\Gamma_1$  by an  $\mathcal{FM}_{m,n}$ -map  $f: Y \rightarrow Y_1$  covering  $\underline{f}: M \rightarrow M_1$  (i.e.  $J^1 f \circ \Gamma = \Gamma_1 \circ f$ ) and  $\nabla$  is  $\underline{f}$ -related to  $\nabla_1$  (i.e.  $J^1 T \underline{f} \circ \nabla = \nabla_1 \circ T \underline{f}$ ), then  $D_Y(\Gamma, \nabla)$  is  $Ff$ -related to  $D_{Y_1}(\Gamma_1, \nabla_1)$  (i.e.  $J^1 F \underline{f} \circ D_Y(\Gamma, \nabla) = D_{Y_1}(\Gamma_1, \nabla_1) \circ Ff$ ). Equivalently the  $\mathcal{FM}_{m,n}$ -invariance means that for any  $\Gamma \in \text{Con}(Y \rightarrow M)$ ,  $\Gamma_1 \in \text{Con}(Y_1 \rightarrow M_1)$ ,  $\nabla \in Q_\tau(M)$  and  $\nabla_1 \in Q_\tau(M_1)$  if diagrams

$$\begin{array}{ccc} J^1 Y & \xrightarrow{J^1 f} & J^1 Y_1 \\ \Gamma \uparrow & & \uparrow \Gamma_1 \\ Y & \xrightarrow{f} & Y_1 \end{array} \quad \begin{array}{ccc} J^1 TM & \xrightarrow{J^1 T \underline{f}} & J^1 TM_1 \\ \nabla \uparrow & & \uparrow \nabla_1 \\ TM & \xrightarrow{T \underline{f}} & TM_1 \end{array}$$

commute for a  $\mathcal{FM}_{m,n}$ -map  $f: Y \rightarrow Y_1$  covering  $\underline{f}: M \rightarrow M_1$ , then the diagram

$$\begin{array}{ccc} J^1 FY & \xrightarrow{J^1 F \underline{f}} & J^1 FY_1 \\ D_Y(\Gamma, \nabla) \uparrow & & \uparrow D_{Y_1}(\Gamma_1, \nabla_1) \\ FY & \xrightarrow{Ff} & FY_1 \end{array}$$

commutes. We say that the operator  $D_Y$  is regular if it transforms smoothly parametrized families of connections into smoothly parametrized ones.

**Definition 2.** A  $\mathcal{M}f_m$ -natural operator  $A: Q_\tau \rightsquigarrow Q^r$  extending torsion free classical linear connections  $\nabla$  on  $m$ -dimensional manifolds  $M$  into  $r$ -th order linear connections  $A(\nabla): TM \rightarrow J^r TM$  on  $M$  is a system of regular

operators  $A_M: Q_\tau(M) \rightarrow Q^r(M)$ ,  $M \in \text{Obj}(\mathcal{M}f_m)$  satisfying the  $\mathcal{M}f_m$ -invariance condition: if  $\nabla \in Q_\tau(M)$  and  $\nabla_1 \in Q_\tau(M_1)$  are  $f$ -related by a  $\mathcal{M}f_m$ -map  $f: M \rightarrow M_1$  (i.e.  $J^1Tf \circ \nabla = \nabla_1 \circ Tf$ ), then  $A(\nabla)$  and  $A(\nabla_1)$  are  $f$ -related, too (i.e.  $J^rTf \circ A(\nabla) = A(\nabla_1) \circ Tf$ ). In other words, the  $\mathcal{M}f_m$ -invariance means that if for any  $\nabla \in Q_\tau(M)$ ,  $\nabla_1 \in Q_\tau(M_1)$  the diagram

$$\begin{array}{ccc} J^1TM & \xrightarrow{J^1Tf} & J^1TM_1 \\ \nabla \uparrow & & \uparrow \nabla_1 \\ TM & \xrightarrow{Tf} & TM_1 \end{array}$$

commutes for a  $\mathcal{M}f_m$ -map  $f: M \rightarrow M_1$ , then the following diagram

$$\begin{array}{ccc} J^rTM & \xrightarrow{J^rTf} & J^rTM_1 \\ A(\nabla) \uparrow & & \uparrow A(\nabla_1) \\ TM & \xrightarrow{Tf} & TM_1 \end{array}$$

commutes, too. The regularity means that every  $A_M$  transforms smoothly parametrized families of connections into smoothly parametrized ones.

Thus the construction  $\mathcal{F}(\Gamma, \Lambda)$  can be considered as the  $\mathcal{F}\mathcal{M}_{m,n}$ -natural operator  $\mathcal{F}: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(F \rightarrow \mathcal{B})$ . Similarly, the correspondence  $E_r: Q_\tau \rightsquigarrow Q^r$  is the  $\mathcal{M}f_m$ -natural operator.

In [4], the authors described all  $\mathcal{F}\mathcal{M}_{m,n}$ -natural operators  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(F \rightarrow \mathcal{B})$  for a bundle functor  $F = J^1: \mathcal{F}\mathcal{M}_{m,n} \rightarrow \mathcal{F}\mathcal{M}$ . They constructed an additional  $\mathcal{F}\mathcal{M}_{m,n}$ -natural operator  $P$  and proved that all  $\mathcal{F}\mathcal{M}_{m,n}$ -natural operators  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^1 \rightarrow \mathcal{B})$  form the one parameter family  $tP + (1-t)J^1$ ,  $t \in \mathbf{R}$ .

In this paper we determine all  $\mathcal{F}\mathcal{M}_{m,n}$ -natural operators  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^2 \rightarrow \mathcal{B})$ . We assume that all manifolds and maps are smooth, i.e. of class  $C^\infty$ .

**2. Quasi-normal fibred coordinate systems.** Let  $\Gamma: Y \rightarrow J^1Y$  be a general connection on a fibred manifold  $p: Y \rightarrow M$  with  $\dim(M) = m$  and  $\dim(Y) = m + n$ ,  $\nabla$  be a torsion free classical linear connection on  $M$  and  $y_0 \in Y$  be a point with  $x_0 = p(y_0) \in M$ .

In [8] W. Mikulski presented a concept of  $(\Gamma, \nabla, y_0, r)$ -quasi-normal fibred coordinate systems on  $Y$  for any  $r$ . For  $r = 3$  this concept can be equivalently defined in the following way.

**Definition 3.** A  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinate system on  $Y$  is a fibred chart  $\psi$  on  $Y$  with  $\psi(y_0) = (0, 0) \in \mathbf{R}^{m,n}$  covering a chart  $\underline{\psi}$  on  $M$  with centre  $x_0$  if the map  $id_{\mathbf{R}^m}$  is a  $\underline{\psi}_*$   $\nabla$ -normal coordinate system with

centre  $0 \in \mathbf{R}^m$  and an element  $j_{(0,0)}^2(\psi_*\Gamma) \in J_{(0,0)}^2(J^1\mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n})$  is of the form

$$(1) \quad \begin{aligned} j_{(0,0)}^2(\psi_*\Gamma) = & j_{(0,0)}^2 \left( \Gamma_0 + \sum_{i,j,k=1}^m \sum_{p=1}^n a_{kij}^p x^k x^i dx^j \otimes \frac{\partial}{\partial y^p} \right. \\ & \left. + \sum_{i,j=1}^m \sum_{p,q=1}^n b_{qij}^p y^q x^i dx^j \otimes \frac{\partial}{\partial y^p} + \sum_{i,j=1}^m \sum_{p=1}^n c_{ij}^p x^i dx^j \otimes \frac{\partial}{\partial y^p} \right) \end{aligned}$$

for some (uniquely determined) real numbers  $a_{kij}^p, b_{qij}^p$  and  $c_{ij}^p$  satisfying

$$(2) \quad \begin{aligned} a_{kij}^p - a_{ikj}^p &= 0 \\ a_{kij}^p + a_{kji}^p + a_{ikj}^p + a_{ijk}^p + a_{jik}^p + a_{jki}^p &= 0 \\ b_{qij}^p + b_{qji}^p &= 0 \\ c_{ij}^p + c_{ji}^p &= 0, \end{aligned}$$

where  $\Gamma_0 = \sum_{i=1}^m dx^i \otimes \frac{\partial}{\partial x^i}$  is the trivial general connection on  $\mathbf{R}^{m,n}$  and  $x^1, \dots, x^m, y^1, \dots, y^n$  are the usual fibred coordinates on  $\mathbf{R}^{m,n}$ .

In [8] W. Mikulski proved an important proposition ([8], Proposition 2.2) concerning  $(\Gamma, \nabla, y_0, r)$ -quasi-normal fibred coordinate systems. Below we recall this result for  $r = 3$ . A fibred-fibred manifold version of Proposition 2.2 from [8] for  $r = 1$  is presented in [7].

**Proposition 1.** *Let  $\Gamma: Y \rightarrow J^1Y$  be a general connection on a fibred manifold  $p: Y \rightarrow M$  with  $\dim(M) = m$  and  $\dim(Y) = m + n, \nabla$  be a torsion free classical linear connection on  $M$  and  $y_0 \in Y$  be a point with  $x_0 = p(y_0) \in M$ . Then:*

- (i) *There exists a  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinate system  $\psi$  on  $Y$ .*
- (ii) *If  $\psi^1$  is another  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinate system, then*

$$(3) \quad j_{y_0}^3 \psi^1 = j_{y_0}^3 ((B \times H) \circ \psi)$$

for a linear map  $B \in GL(m)$  and diffeomorphism  $H: \mathbf{R}^n \rightarrow \mathbf{R}^n$  preserving 0.

From the proof of Proposition 2.2 from [8] it follows that  $(B \times H) \circ \psi$  is a  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinate system for any  $B \in GL(m)$  and any diffeomorphism  $H: \mathbf{R}^n \rightarrow \mathbf{R}^n$  preserving 0. In other words, the  $\mathcal{FM}_{m,n}$ -maps of the form  $B \times H$  for  $B \in GL(m)$  and diffeomorphisms  $H: \mathbf{R}^n \rightarrow \mathbf{R}^n$  preserving 0 in  $\mathbf{R}^n$  transform quasi-normal fibred coordinate systems into quasi-normal ones.

From now on we will usually work in  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinates for considered  $\Gamma$  and  $\nabla$ . If coordinates are not necessarily quasi-normal, the reader will be informed.

**3. Constructions of connections.** Let  $\Gamma: Y \rightarrow J^1Y$  be a general connection on an  $\mathcal{FM}_{m,n}$ -object  $p: Y \rightarrow M$  and let  $\nabla: TM \rightarrow J^1TM$  be a torsion free classical linear connection on  $M$ .

**Example 1.** Let  $A: Q_\tau \rightsquigarrow Q^2$  be a  $\mathcal{M}f_m$ -natural operator and let  $\Lambda = A(\nabla): TM \rightarrow J^2TM$  be a second order linear connection on  $M$  canonically depending on  $\nabla$ . Then from Introduction for a functor  $F = J^2$ , we have a general connection

$$(4) \quad \mathcal{J}_{(A)}^2(\Gamma, \nabla) := \mathcal{J}^2(\Gamma, A(\nabla)): J^2Y \rightarrow J^1J^2Y$$

on  $J^2Y \rightarrow M$  canonically depending on  $\Gamma$  and  $\nabla$ .

Because of the canonical character of the construction  $\mathcal{J}_{(A)}^2(\Gamma, \nabla)$  we obtain the following proposition.

**Proposition 2.** *The family  $\mathcal{J}_{(A)}^2: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^2 \rightarrow \mathcal{B})$  of functions*

$$\mathcal{J}_{(A)}^2: \text{Con}(Y \rightarrow M) \times Q_\tau(M) \rightarrow \text{Con}(J^2Y \rightarrow M)$$

*for all  $\mathcal{FM}_{m,n}$ -objects  $Y \rightarrow M$  is an  $\mathcal{FM}_{m,n}$ -natural operator.*

**Example 2.** For every torsion free classical linear connection  $\nabla$  on a manifold  $M$  we have a canonical vector bundle isomorphism  $\psi_\nabla: J^2TM \rightarrow \bigoplus_{k=0}^2 S^k T^*M \otimes TM$  given by a formula

$$\psi_\nabla(\tau) = \bigoplus_{k=0}^2 S^k T_0^* \varphi^{-1} \otimes T_0 \varphi^{-1} (I(J^2 T \varphi(\tau))),$$

where  $\tau \in J_x^2 TM$ ,  $x \in M$ ,  $\varphi$  is a  $\nabla$ -normal coordinate system on  $M$  with centre  $x$  and  $I: J_0^2 \mathbf{TR}^m \rightarrow \bigoplus_{k=0}^2 S^k T_0^* \mathbf{R}^m \otimes T_0 \mathbf{R}^m$  is the usual identification.

In the main result of [9], W. Mikulski showed that  $\mathcal{M}f_m$ -natural operators  $A: Q_\tau \rightsquigarrow Q^2$  are in bijection with  $\mathcal{M}f_m$ -natural operators  $A_0 \equiv 0: Q_\tau \rightsquigarrow T^* \otimes T$ ,  $A_1: Q_\tau \rightsquigarrow T^* \otimes T^* \otimes T$  and  $A_2: Q_\tau \rightsquigarrow T^* \otimes S^2 T^* \otimes T$ . In other words, the second order linear connections  $\Lambda = A(\nabla): TM \rightarrow J^2TM$  on  $M$  canonically depending on  $\nabla$  are in bijection with the tensor fields  $A_0(\nabla) \equiv 0: M \rightarrow T^*M \otimes TM$ ,  $A_1(\nabla): M \rightarrow T^*M \otimes T^*M \otimes TM$  and  $A_2(\nabla): M \rightarrow T^*M \otimes S^2 T^*M \otimes TM$  on  $M$  canonically depending on  $\nabla$ .

Now by means of  $\psi_\nabla$ ,  $A_1(\nabla) \equiv 0$  and  $A_2(\nabla)$  we can define a second order linear connection  $A(\nabla): TM \rightarrow J^2TM$  on  $M$  by

$$(5) \quad A(\nabla)(v) = \psi_\nabla^{-1}(v, 0, \langle A_2(\nabla)(x), v \rangle), v \in T_x M, x \in M$$

In particular, for  $A_2(\nabla) \equiv 0: M \rightarrow T^*M \otimes S^2 T^*M \otimes TM$  we obtain

$$(6) \quad A_2^{exp}(\nabla)(v) = \psi_\nabla^{-1}(v, 0, 0): TM \rightarrow J^2TM,$$

On the other hand, from [9] it follows that

$$A_2^{exp}(\nabla)(v) = E_2(\nabla)(v).$$

It means that  $A_2^{exp}(\nabla)$  is the second order exponential extension of  $\nabla$ .

Finally, in the accordance with Example 1 we have a general connection

$$(7) \quad \mathcal{J}_{(A_2^{exp})}^2(\Gamma, \nabla) := \mathcal{J}^2(\Gamma, A_2^{exp}(\nabla)): J^2Y \rightarrow J^1J^2Y$$

on  $J^2Y \rightarrow M$  canonically depending on  $\Gamma$  and  $\nabla$ .

**Example 3.** Let  $\rho \in (J^2Y)_{y_0}$ ,  $y_0 \in Y_{x_0}$ ,  $x_0 \in M$  and consider a  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinate system  $\psi$  on  $Y$ . Then

$$j_{(0,0)}^2(\psi_*\Gamma) = j_{(0,0)}^2\left(\Gamma_0 + \sum_{i,j,k=1}^m \sum_{p=1}^n a_{kij}^p x^k x^i dx^j \otimes \frac{\partial}{\partial y^p} + \sum_{i,j=1}^m \sum_{p,q=1}^n b_{qij}^p y^q x^i dx^j \otimes \frac{\partial}{\partial y^p} + \sum_{i,j=1}^m \sum_{p=1}^n c_{ij}^p x^i dx^j \otimes \frac{\partial}{\partial y^p}\right)$$

for unique real numbers  $a_{kij}^p, b_{qij}^p$  and  $c_{ij}^p$  satisfying (2). Denote

$$(8) \quad \begin{aligned} \Gamma^{[1]} &= \Gamma_0 + \sum_{i,j,k=1}^m \sum_{p=1}^n a_{kij}^p x^k x^i dx^j \otimes \frac{\partial}{\partial y^p}, \\ \Gamma^{[2]} &= \Gamma_0 + \sum_{i,j=1}^m \sum_{p,q=1}^n b_{qij}^p y^q x^i dx^j \otimes \frac{\partial}{\partial y^p} + \sum_{i,j=1}^m \sum_{p=1}^n c_{ij}^p x^i dx^j \otimes \frac{\partial}{\partial y^p}. \end{aligned}$$

Now we define general connections  $\mathcal{J}_{[1]}^2(\Gamma, \nabla): J^2Y \rightarrow J^1J^2Y$  and  $\mathcal{J}_{[2]}^2(\Gamma, \nabla): J^2Y \rightarrow J^1J^2Y$  on  $J^2Y \rightarrow M$  by

$$(9) \quad \begin{aligned} \mathcal{J}_{[1]}^2(\Gamma, \nabla)(\rho) &:= J^1J^2(\psi^{-1})(\mathcal{J}_{(A^{exp})}^2(\Gamma^{[1]}, \nabla^0)(J^2\psi(\rho))), \\ \mathcal{J}_{[2]}^2(\Gamma, \nabla)(\rho) &:= J^1J^2(\psi^{-1})(\mathcal{J}_{(A^{exp})}^2(\Gamma^{[2]}, \nabla^0)(J^2\psi(\rho))), \end{aligned}$$

where  $\nabla^0$  is the usual flat classical linear connection on  $\mathbf{R}^m$ .

Because of the canonical character of the construction  $\mathcal{J}_{[i]}^2(\Gamma, \nabla)$  for  $i = 1, 2$  we have the following proposition.

**Proposition 3.** *The family  $\mathcal{J}_{[i]}^2: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^2 \rightarrow \mathcal{B})$  of functions*

$$\mathcal{J}_{[i]}^2: \text{Con}(Y \rightarrow M) \times Q_\tau(M) \rightarrow \text{Con}(J^2Y \rightarrow M)$$

for all  $\mathcal{FM}_{m,n}$ -objects  $Y \rightarrow M$  is an  $\mathcal{FM}_{m,n}$ -natural operator.

**4. The main result.** We can consider the first jet prolongation functor  $J^1$  as an affine bundle functor on the category  $\mathcal{FM}_{m,n}$ . The corresponding vector bundle functor is  $T^*\mathcal{B} \otimes V$ , where  $\mathcal{B}: \mathcal{FM}_{m,n} \rightarrow \mathcal{M}f_m$  is a base functor and  $V$  is a vertical tangent functor. For this reason, for any fibred manifold  $p: Y \rightarrow M$  from the category  $\mathcal{FM}_{m,n}$ , the first jet prolongation  $J^1Y \rightarrow Y$  is the affine bundle with the corresponding vector bundle  $T^*M \otimes VY$ . Therefore,  $J^1J^2Y \rightarrow J^2Y$  is the affine bundle with corresponding vector bundle  $T^*M \otimes VJ^2Y$ . Thus the set of all  $\mathcal{FM}_{m,n}$ -natural operators  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^2 \rightarrow \mathcal{B})$  possesses the affine space structure.

The following theorem classifies all  $\mathcal{FM}_{m,n}$ -natural operators  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^2 \rightarrow \mathcal{B})$ .

**Theorem 1.** *Let  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^2 \rightarrow \mathcal{B})$  be an  $\mathcal{FM}_{m,n}$ -natural operator transforming general connections  $\Gamma: Y \rightarrow J^1Y$  on  $\mathcal{FM}_{m,n}$ -objects  $Y \rightarrow M$  and torsion free classical linear connections  $\nabla$  on  $M$  into general connections  $D(\Gamma, \nabla): J^2Y \rightarrow J^1J^2Y$  on  $J^2Y \rightarrow M$ .*

*If  $m \geq 2$ , then there exist uniquely determined real numbers  $t_0, t_1, t_2$  with  $t_0 + t_1 + t_2 = 1$  and  $\mathcal{M}f_m$ -natural operator  $A: Q_\tau \rightsquigarrow Q^2$  transforming torsion free classical linear connections  $\nabla$  on  $\mathcal{M}f_m$ -objects  $M$  into second order linear connections  $A(\nabla): TM \rightarrow J^2TM$  on  $M$  such that*

$$(10) \quad D(\Gamma, \nabla) = t_0 \mathcal{J}_{(A)}^2(\Gamma, \nabla) + t_1 \mathcal{J}_{[1]}^2(\Gamma, \nabla) + t_2 \mathcal{J}_{[2]}^2(\Gamma, \nabla)$$

*for any  $\mathcal{FM}_{m,n}$ -object  $Y \rightarrow M$ , any general connection  $\Gamma$  on  $Y \rightarrow M$  and any torsion free classical linear connection  $\nabla$  on  $M$ . Besides, if  $t_0 \neq 0$ , then  $A$  is uniquely determined (else  $A$  can be arbitrary).*

*In the case  $m = 1$ ,  $D = \mathcal{J}^2$ .*

In the proof we use methods for finding natural operators presented in [4] and lemmas from [1].

**Proof.** Let  $x^i, y^p$  be the usual fibred coordinates on  $\mathbf{R}^{m,n}$ ,

$$y_i^p = \frac{\partial y^p}{\partial x^i}, \quad y_{ij}^p = y_{ji}^p = \frac{\partial^2 y^p}{\partial x^i \partial x^j}$$

be the additional coordinates on  $J^2\mathbf{R}^{m,n}$  and

$$Y^p = dy^p, \quad Y_i^p = dy_i^p, \quad Y_{ij}^p = Y_{ji}^p = dy_{ij}^p$$

be the essential coordinates on the vertical bundle  $VJ^2\mathbf{R}^{m,n}$  of  $J^2\mathbf{R}^{m,n} \rightarrow \mathbf{R}^m$ , where  $i, j = 1, \dots, m$  and  $p = 1, \dots, n$ .

On  $J_0^2(J^1\mathbf{R}^{m,n})$  we have the coordinates

$$\begin{aligned} \Gamma_i^p, \quad \Gamma_{ij}^p &= \frac{\partial \Gamma_i^p}{\partial x^j}, \quad \Gamma_{iq}^p = \frac{\partial \Gamma_i^p}{\partial y^q}, \quad \Gamma_{ijk}^p = \frac{\partial^2 \Gamma_i^p}{\partial x^j \partial x^k}, \\ \Gamma_{iqr}^p &= \frac{\partial^2 \Gamma_i^p}{\partial y^q \partial y^r}, \quad \Gamma_{ijq}^p = \frac{\partial^2 \Gamma_i^p}{\partial x^j \partial y^q}. \end{aligned}$$

The standard coordinates on  $J_0^1(Q_\tau(\mathbf{R}^m))$  are  $\nabla_{jk}^i = \nabla_{kj}^i$  and  $\nabla_{jkl}^i = \nabla_{kjl}^i$ , where  $i, j, k, l = 1, \dots, m$ .

Let  $\omega_k$  be the usual coordinates on  $T^*\mathbf{R}^m$ . Then the induced coordinates on the tensor product  $(T^*\mathbf{R}^m \otimes VJ^2\mathbf{R}^{m,n})_0$  are

$$Z_k^p = Y^p \omega_k, \quad Z_{i;k}^p = Y_i^p \omega_k, \quad Z_{ij;k}^p = Y_{ij}^p \omega_k.$$

Let  $D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow J^1(J^2 \rightarrow \mathcal{B})$  be an  $\mathcal{FM}_{m,n}$ -natural operator transforming general connections  $\Gamma: Y \rightarrow J^1Y$  on  $\mathcal{FM}_{m,n}$ -objects  $Y \rightarrow M$  and

torsion free classical linear connections  $\nabla$  on  $M$  into general connections  $D(\Gamma, \nabla): J^2Y \rightarrow J^1J^2Y$  on  $J^2Y \rightarrow M$ .

Since  $J^1J^2Y \rightarrow J^2Y$  is the affine bundle with the corresponding vector bundle  $T^*M \otimes VJ^2Y$ , we have the corresponding  $\mathcal{FM}_{m,n}$ -natural operator

$$\Delta_D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow (J^2, T^*\mathcal{B} \otimes VJ^2).$$

It transforms a general connection  $\Gamma: Y \rightarrow J^1Y$  on an  $\mathcal{FM}_{m,n}$ -object  $Y \rightarrow M$  and a torsion free classical linear connection  $\nabla$  on  $M$  into a fibred map

$$(11) \quad \Delta_D(\Gamma, \nabla) := D(\Gamma, \nabla) - \mathcal{J}_{(A_2^{exp})}^2(\Gamma, \nabla): J^2Y \rightarrow T^*M \otimes VJ^2Y.$$

Of course, the operator  $D$  is fully determined by  $\Delta_D$  as  $D(\Gamma, \nabla) = \Delta_D(\Gamma, \nabla) + \mathcal{J}_{(A_2^{exp})}^2(\Gamma, \nabla)$  for every  $\Gamma \in \text{Con}(Y \rightarrow M), \nabla \in Q_\tau(M)$ . In other words  $D = \Delta_D + \mathcal{J}_{(A_2^{exp})}^2$ , so it is sufficient to investigate the operator  $\Delta_D$ .

Using the invariance of  $\Delta_D$  with respect to the homotheties  $\psi_t = \text{tid}_{\mathbf{R}^{m,n}}$  covering  $\underline{\psi}_t = \text{tid}_{\mathbf{R}^m}$  for  $t > 0$ , we have the homogeneous conditions

$$\begin{aligned} & (T^*(\text{tid}_{\mathbf{R}^m}) \otimes VJ^2(\text{tid}_{\mathbf{R}^{m,n}}))(\Delta_D(\Gamma, \nabla)(\rho)) \\ & = (\Delta_D((\text{tid}_{\mathbf{R}^{m,n}})_*\Gamma, (\text{tid}_{\mathbf{R}^m})_*\nabla))(J^2(\text{tid}_{\mathbf{R}^{m,n}})(\rho)) \end{aligned}$$

for any general connection  $\Gamma$  on  $\mathbf{R}^{m,n}$ , any torsion free classical linear connection  $\nabla$  on  $\mathbf{R}^m$  and any  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$ . Using the general theory and the above local coordinates, the above condition can be written as the system of homogeneous conditions. Now, by the non-linear Peetre theorem [4] we obtain that the operator  $\Delta_D$  is of finite order  $r$  in  $\Gamma$  and of order  $s$  in  $\nabla$ . Having the natural operator  $\Delta_D$  of order  $r$  in  $\Gamma$  and of finite order  $s$  in  $\nabla$ , we shall deduce that  $r = 2$  and  $s = 1$ .

The operators  $\Delta_D$  of order 2 in  $\Gamma$  and of order 1 in  $\nabla$  are in bijection with  $G_{m,n}^3$ -invariant maps of standard fibres  $f: S_1 \times \Lambda \times S_0 \rightarrow Z$  over  $\underline{f} = \text{id}_{S_0}$ , where  $S_1 = J_0^2(J^1\mathbf{R}^{m,n}), \Lambda = J_0^1(Q_\tau(\mathbf{R}^m)), S_0 = J_0^2\mathbf{R}^{m,n}, Z = (T^*\mathbf{R}^m \otimes VJ^2\mathbf{R}^{m,n})_0$ . This map is of the form

$$\begin{aligned} Z_k^p &= f_k^p(\Gamma_i^p, \Gamma_{ij}^p, \Gamma_{iq}^p, \Gamma_{ijk}^p, \Gamma_{iqr}^p, \Gamma_{ijq}^p, \nabla_{jk}^i, \nabla_{jkl}^i, y_i^p, y_{ij}^p) \\ Z_{i;k}^p &= f_{i;k}^p(\Gamma_i^p, \Gamma_{ij}^p, \Gamma_{iq}^p, \Gamma_{ijk}^p, \Gamma_{iqr}^p, \Gamma_{ijq}^p, \nabla_{jk}^i, \nabla_{jkl}^i, y_i^p, y_{ij}^p) \\ Z_{ij;k}^p &= f_{ij;k}^p(\Gamma_i^p, \Gamma_{ij}^p, \Gamma_{iq}^p, \Gamma_{ijk}^p, \Gamma_{iqr}^p, \Gamma_{ijq}^p, \nabla_{jk}^i, \nabla_{jkl}^i, y_i^p, y_{ij}^p). \end{aligned}$$

The group  $G_{m,n}^3$  acts on the standard fibre  $S_0$  in the form

$$\begin{aligned} \bar{y}_i^p &= a_q^p y_j^q \tilde{a}_i^j + a_j^p \tilde{a}_i^j \\ \bar{y}_{ij}^p &= a_q^p y_{kl}^q \tilde{a}_i^k \tilde{a}_j^l + a_{qr}^p y_k^q y_l^r \tilde{a}_i^k \tilde{a}_j^l + a_{qk}^p y_l^q \tilde{a}_i^k \tilde{a}_j^l + a_{ql}^p y_k^q \tilde{a}_i^k \tilde{a}_j^l \\ & \quad + a_q^p y_k^q \tilde{a}_{ij}^k + a_k^p \tilde{a}_{ij}^k + a_{kl}^p \tilde{a}_i^k \tilde{a}_j^l \end{aligned}$$

and on the fibre  $S_1$  by the formula

$$\begin{aligned}
\bar{\Gamma}_i^p &= a_q^p \Gamma_j^q \tilde{a}_i^j + a_j^p \tilde{a}_i^j \\
\bar{\Gamma}_{ij}^p &= a_q^p \Gamma_{kl}^q \tilde{a}_i^k \tilde{a}_j^l + a_{qr}^p \Gamma_k^r \Gamma_l^q \tilde{a}_i^k \tilde{a}_j^l + a_{qk}^p \Gamma_l^q \tilde{a}_i^k \tilde{a}_j^l + a_{ql}^p \Gamma_k^q \tilde{a}_i^k \tilde{a}_j^l + a_q^p \Gamma_k^q \tilde{a}_i^k \tilde{a}_j^j \\
&\quad + a_k^p \tilde{a}_{ij}^k + a_{kl}^p \tilde{a}_i^k \tilde{a}_j^l \\
\bar{\Gamma}_{iq}^p &= a_r^p \Gamma_{js}^r \tilde{a}_q^s \tilde{a}_i^j + a_{rs}^p \Gamma_j^r \tilde{a}_q^s \tilde{a}_i^j + a_{rj}^p \tilde{a}_q^r \tilde{a}_i^j \\
\bar{\Gamma}_{ijk}^p &= [(a_{qn}^p + a_{qr}^p \Gamma_n^r) \Gamma_{lm}^q + (a_{nqr}^p + a_{qrs}^p \Gamma_n^s) \Gamma_l^q \Gamma_m^r + a_q^p \Gamma_{lmn}^q \\
&\quad + a_{qr}^p (\Gamma_{ln}^q \Gamma_m^r + \Gamma_l^q \Gamma_{mn}^r) + (a_{qln}^p + a_{qrl}^p \Gamma_n^r) \Gamma_m^q + a_{ql}^p \Gamma_{mn}^q \\
&\quad + (a_{qmn}^p + a_{qrm}^p \Gamma_n^r) \Gamma_l^q + a_{qm}^p \Gamma_{ln}^q + a_{lmn}^p + a_{lmq}^p \Gamma_n^q] \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n \\
&\quad + (a_q^p \Gamma_{lm}^q + a_{qr}^p \Gamma_l^q \Gamma_m^r + a_{ql}^p \Gamma_m^q + a_{qm}^p \Gamma_l^q + a_{lm}^p) (\tilde{a}_{ik}^l \tilde{a}_j^m + \tilde{a}_i^l \tilde{a}_{jk}^m) \\
&\quad + [(a_{qn}^p + a_{qr}^p \Gamma_n^r) \Gamma_l^q + a_q^p \Gamma_{ln}^q + a_{ln}^p + a_{ql}^p \Gamma_n^q] \tilde{a}_i^l \tilde{a}_k^n + (a_q^p \Gamma_l^q + a_l^p) \tilde{a}_{ijk}^l \\
\bar{\Gamma}_{iqr}^p &= (a_{su}^p \Gamma_{jt}^s + a_{st}^p \Gamma_{ju}^s + a_{stu}^p \Gamma_j^s + a_{st}^p \Gamma_{ju}^s + a_{jtu}^p) \tilde{a}_i^j \tilde{a}_q^t \tilde{a}_r^u \\
\bar{\Gamma}_{ijq}^p &= (a_{rt}^p \Gamma_{kl}^r + a_r^p \Gamma_{klt}^r + a_{rst}^p \Gamma_k^r \Gamma_l^s + a_{rs}^p \Gamma_{kt}^r \Gamma_l^s + a_{rs}^p \Gamma_k^r \Gamma_{lt}^s + a_{rkt}^p \Gamma_l^r \\
&\quad + a_{rk}^p \Gamma_{lt}^r + a_{rlt}^p \Gamma_k^r + a_{rl}^p \Gamma_{kt}^r + a_{klt}^p) \tilde{a}_i^k \tilde{a}_j^l \tilde{a}_q^t \\
&\quad + (a_{rt}^p \Gamma_k^r + a_r^p \Gamma_{kt}^r + a_{kt}^p) \tilde{a}_{ij}^k \tilde{a}_q^t.
\end{aligned}$$

The action on  $\Lambda$  is

$$\begin{aligned}
\bar{\nabla}_{jk}^i &= a_l^i \nabla_{mn}^l \tilde{a}_j^m \tilde{a}_k^n + a_{lm}^i \tilde{a}_j^l \tilde{a}_k^m \\
\bar{\nabla}_{jkl}^i &= a_p^i \nabla_{mnq}^p \tilde{a}_l^q \tilde{a}_k^m \tilde{a}_j^n + a_p^i \nabla_{sm}^p \tilde{a}_l^m \tilde{a}_{jk}^s + a_{ps}^i \nabla_{mn}^p \tilde{a}_l^m \tilde{a}_j^s \tilde{a}_k^n + a_{ps}^i \nabla_{nm}^p \tilde{a}_l^m \tilde{a}_j^s \tilde{a}_k^n \\
&\quad + a_{mnq}^i \tilde{a}_l^q \tilde{a}_k^m \tilde{a}_j^n + a_{sm}^i \tilde{a}_{kj}^s \tilde{a}_l^m.
\end{aligned}$$

Finally, the group  $G_{m,n}^3$  acts on  $Z$  in the form

$$\begin{aligned}
\bar{Z}_k^p &= a_q^p Z_l^q \tilde{a}_k^l \\
\bar{Z}_{i;k}^p &= a_{qr}^p Y^r y_j^q \omega_l \tilde{a}_i^j \tilde{a}_k^l + a_q^p Z_{j;l}^q \tilde{a}_i^j \tilde{a}_k^l + a_{qj}^p Z_l^q \tilde{a}_i^j \tilde{a}_k^l \\
\bar{Z}_{ij;k}^p &= a_{qr}^p Y^r y_{lm}^q \omega_n \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_q^p Z_{lm;n}^q \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_{qrs}^p Y^s y_l^q y_m^r \omega_n \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n \\
&\quad + a_{qr}^p (Y_l^q y_m^r + y_l^q Y_m^r) \omega_n \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_{qrl}^p Y^r y_m^q \omega_n \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n \\
&\quad + a_{ql}^p Z_{m;n}^q \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_{qrm}^p Y^r y_l^q \omega_n \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_{qm}^p Z_{l;n}^q \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n \\
&\quad + a_{qr}^p Y^r y_l^q \omega_n \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_q^p Z_{l;n}^q \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_{ql}^p Z_n^q \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n + a_{qlm}^p Z_n^q \tilde{a}_i^l \tilde{a}_j^m \tilde{a}_k^n.
\end{aligned}$$

Now we want to show that every  $\mathcal{FM}_{m,n}$ -natural operator  $\Delta_D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow (J^2, T^* \mathcal{B} \otimes V J^2)$  is of order 2 in  $\Gamma$  and of order 1 in  $\nabla$ . Using the general theory, the operators in question are in bijection with  $G_{m,n}^q$ -invariant maps

$$f: J_0^r(J^1 \mathbf{R}^{m,n}) \times J_0^s(Q_\tau(\mathbf{R}^m)) \times J_0^2 \mathbf{R}^{m,n} \rightarrow (T^* \mathbf{R}^m \otimes V J^2 \mathbf{R}^{m,n})_0,$$

where  $q = \max\{\text{rank}(J^r J^1), \text{rank}(J^s Q_\tau), \text{rank}(J^2), \text{rank}(T^*), \text{rank}(V J^2)\} = \max\{r + 1, s + 2, 2, 1, 3\} = \max\{r + 1, s + 2, 3\} \geq 3$ .

We shall investigate these maps. Let  $\alpha$  and  $\gamma$  be multi indices in  $x^i$  and  $\beta$  be a multi index in  $y^p$ . This associated map of our operator has the form

$$\begin{aligned} Z_k^p &= f_k^p((\Gamma_i^p)_{\alpha\beta}, (\nabla_{jk}^i)_\gamma, y_i^p, y_{ij}^p) \\ Z_{i;k}^p &= f_{i;k}^p((\Gamma_i^p)_{\alpha\beta}, (\nabla_{jk}^i)_\gamma, y_i^p, y_{ij}^p) \\ Z_{ij;k}^p &= f_{ij;k}^p((\Gamma_i^p)_{\alpha\beta}, (\nabla_{jk}^i)_\gamma, y_i^p, y_{ij}^p), \end{aligned}$$

where  $|\alpha| + |\beta| \leq r$  and  $|\gamma| \leq s$ .

Using the homotheties

$$\begin{aligned} \tilde{a}_j^i &= t\delta_j^i, \quad \tilde{a}_q^p = \delta_q^p, \quad a_i^p = 0, \quad a_{qr}^p = 0, \quad a_{qi}^p = 0, \quad \tilde{a}_{ij}^k = 0, \quad a_{ij}^p = 0, \quad a_{qri}^p = 0, \\ a_{qrs}^p &= 0, \quad a_{qij}^p = 0, \quad a_{ijk}^p = 0, \quad \tilde{a}_{ijk}^l = 0, \end{aligned}$$

we obtain

$$t f_k^p = f_k^p(t^{1+|\alpha|}(\Gamma_i^p)_{\alpha\beta}, t^{1+|\gamma|}(\nabla_{jk}^i)_\gamma, t y_i^p, t^2 y_{ij}^p).$$

From the homogeneous function theorem we deduce that  $f_k^p$  is linear in  $(\Gamma_i^p)_\beta, \nabla_{jk}^i, y_i^p$  and is independent of  $y_{ij}^p$  and of the variables with  $|\alpha| > 0$  or  $|\gamma| > 0$ . Therefore,

$$(12) \quad f_k^p = f_k^p((\Gamma_i^p)_\beta, \nabla_{jk}^i, y_i^p).$$

Considering invariance of (12) with respect to the homotheties

$$\begin{aligned} \tilde{a}_j^i &= \delta_j^i, \quad a_q^p = t\delta_q^p, \quad a_i^p = 0, \quad a_{qr}^p = 0, \quad a_{qi}^p = 0, \quad \tilde{a}_{ij}^k = 0, \quad a_{ij}^p = 0, \quad a_{qri}^p = 0, \\ a_{qrs}^p &= 0, \quad a_{qij}^p = 0, \quad a_{ijk}^p = 0, \quad \tilde{a}_{ijk}^l = 0, \end{aligned}$$

we get the condition

$$t f_k^p = f_k^p(t^{1-|\beta|}(\Gamma_i^p)_\beta, \nabla_{jk}^i, t y_i^p).$$

Using again the homogeneous function theorem, we see that  $f_k^p$  is independent of  $(\Gamma_i^p)_\beta$  with  $|\beta| > 1$ .

For  $f_{i;k}^p$ , the homotheties

$$\begin{aligned} \tilde{a}_j^i &= t\delta_j^i, \quad \tilde{a}_q^p = \delta_q^p, \quad a_i^p = 0, \quad a_{qr}^p = 0, \quad a_{qi}^p = 0, \quad \tilde{a}_{ij}^k = 0, \quad a_{ij}^p = 0, \quad a_{qri}^p = 0, \\ a_{qrs}^p &= 0, \quad a_{qij}^p = 0, \quad a_{ijk}^p = 0, \quad \tilde{a}_{ijk}^l = 0, \end{aligned}$$

yield

$$t^2 f_{i;k}^p = f_{i;k}^p(t^{1+|\alpha|}(\Gamma_i^p)_{\alpha\beta}, t^{1+|\gamma|}(\nabla_{jk}^i)_\gamma, t y_i^p, t^2 y_{ij}^p)$$

so that  $f_{i;k}^p$  is a polynomial independent of the variables with  $|\alpha| > 1$  or  $|\gamma| > 1$ . In other words,

$$(13) \quad f_{i;k}^p = f_{i;k}^p((\Gamma_i^p)_{\alpha\beta}, (\nabla_{jk}^i)_\gamma, y_i^p, y_{ij}^p)$$

for  $|\alpha| \leq 1$  and  $|\gamma| \leq 1$ .

The homotheties

$$\begin{aligned} \tilde{a}_j^i &= \delta_j^i, \quad a_q^p = t\delta_q^p, \quad a_i^p = 0, \quad a_{qr}^p = 0, \quad a_{qi}^p = 0, \quad \tilde{a}_{ij}^k = 0, \quad a_{ij}^p = 0, \quad a_{qri}^p = 0, \\ a_{qrs}^p &= 0, \quad a_{qij}^p = 0, \quad a_{ijk}^p = 0, \quad \tilde{a}_{ijk}^l = 0, \end{aligned}$$

imply

$$t f_{i;k}^p = f_{i;k}^p (t^{1-|\beta|} (\Gamma_i^p)_{\alpha\beta}, (\nabla_{jk}^i)_\gamma, t y_i^p, t y_{ij}^p)$$

for  $|\alpha| \leq 1$  and  $|\gamma| \leq 1$ . Therefore we deduce that  $f_{i;k}^p$  is independent of  $(\Gamma_i^p)_{\alpha\beta}$  for  $|\alpha| + |\beta| > 2$  and  $(\nabla_{jk}^i)_\gamma$  for  $|\gamma| > 1$ .

Now invariance of  $f_{i;k}^p$  with respect to the homotheties

$$\begin{aligned} \tilde{a}_j^i &= t\delta_j^i, \quad \tilde{a}_q^p = t\delta_q^p, \quad a_i^p = 0, \quad a_{qr}^p = 0, \quad a_{qi}^p = 0, \quad \tilde{a}_{ij}^k = 0, \quad a_{ij}^p = 0, \quad a_{qri}^p = 0, \\ a_{qrs}^p &= 0, \quad a_{qij}^p = 0, \quad a_{ijk}^p = 0, \quad \tilde{a}_{ijk}^l = 0, \end{aligned}$$

gives

$$t^2 f_{ij;k}^p = f_{ij;k}^p (t^{|\alpha|+|\beta|} (\Gamma_i^p)_{\alpha\beta}, t^{1+|\gamma|} (\nabla_{jk}^i)_\gamma, y_i^p, t y_{ij}^p).$$

So  $f_{ij;k}^p$  is a polynomial independent of  $(\Gamma_i^p)_{\alpha\beta}$  for  $|\alpha| + |\beta| > 2$  and  $(\nabla_{jk}^i)_\gamma$  for  $|\gamma| > 1$ . Hence the associated map of our operator is independent of  $(\Gamma_i^p)_{\alpha\beta}$  for  $|\alpha| + |\beta| > 2$  and  $(\nabla_{jk}^i)_\gamma$  for  $|\gamma| > 1$ . This completes the proof of the fact that  $\mathcal{FM}_{m,n}$ -natural operator  $\Delta_D: J^1 \times Q_\tau(\mathcal{B}) \rightsquigarrow (J^2, T^*\mathcal{B} \otimes VJ^2)$  is of order 2 in  $\Gamma$  and of order 1 in  $\nabla$ . In other words it means that the value  $\Delta_D(\Gamma, \nabla)(\rho)$  is determined by  $j_{(0,0)}^2 \Gamma$  and  $j_0^1(\nabla)$  and  $\rho$  for any  $\Gamma \in \text{Con}(\mathbf{R}^{m,n})$ ,  $\nabla \in Q_\tau(\mathbf{R}^m)$  and  $\rho \in (J^2 \mathbf{R}^{m,n})_{(0,0)}$ .

In the rest of the proof, we shall use  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinate systems, only. Consider the case  $m \geq 2$ .

Since  $\Delta_D$  is invariant with respect to  $(\Gamma, \nabla, y_0, 3)$ -quasi-normal fibred coordinate systems,  $\Delta_D$  is determined by the contractions  $\langle \Delta_D(\Gamma, \nabla)(\rho), v \rangle \in V_\rho J^2 \mathbf{R}^{m,n}$  for all  $\rho \in (J^2 \mathbf{R}^{m,n})_{(0,0)}$ , all  $v \in T_0 \mathbf{R}^m$ , all general connections  $\Gamma$  on  $\mathbf{R}^{m,n}$  and all torsion free classical linear connections  $\nabla$  on  $\mathbf{R}^m$  such that  $\psi = id_{\mathbf{R}^{m,n}}$  is a  $(\Gamma, \nabla, (0, 0), 3)$ -quasi-normal fibred coordinate system on  $\mathbf{R}^{m,n}$  over  $\underline{\psi} = id_{\mathbf{R}^m}$ .

For vector bundles  $E \rightarrow M$  we have the standard identification  $VE = E \times_M E$  which is a vector bundle isomorphism. As  $\mathbf{R}^{m,n}$  is a vector bundle and  $J^2 \mathbf{R}^{m,n}$  is a vector bundle we can write that  $V_\rho J^2 \mathbf{R}^{m,n} \cong_\rho J_0^2 \mathbf{R}^{m,n}$ . This identification  $\cong_\rho$  is  $GL(m) \times GL(n)$ -invariant but not  $\mathcal{FM}_{m,n}$ -invariant.

Next we use the usual  $GL(m) \times GL(n)$ -invariant identification

$$J_0^2 \mathbf{R}^{m,n} \cong \bigoplus_{k=0}^2 S^k \mathbf{R}^{m*} \otimes \mathbf{R}^n$$

(it is not  $\mathcal{FM}_{m,n}$ -invariant). Therefore, the values  $\langle \Delta_D(\Gamma, \nabla)(\rho), v \rangle$  are determined by the values  $\psi_{\Gamma, \nabla}^k(\rho, v) \in S^k \mathbf{R}^{m*} \otimes \mathbf{R}^n$  for  $k = 0, 1, 2$  obtained by composing the values  $\langle \Delta_D(\Gamma, \nabla)(\rho), v \rangle$  with the respective projections. So we can write

$$\langle \Delta_D(\Gamma, \nabla)(\rho), v \rangle \cong \psi_{\Gamma, \nabla}^0(\rho, v) \oplus \psi_{\Gamma, \nabla}^1(\rho, v) \oplus \psi_{\Gamma, \nabla}^2(\rho, v),$$

where  $\psi_{\Gamma, \nabla}^0(\rho, v) \in \mathbf{R}^n$ ,  $\psi_{\Gamma, \nabla}^1(\rho, v) \in \mathbf{R}^{m*} \otimes \mathbf{R}^n$ ,  $\psi_{\Gamma, \nabla}^2(\rho, v) \in S^2\mathbf{R}^{m*} \otimes \mathbf{R}^n$ .

Now the values  $\psi_{\Gamma, \nabla}^k(\rho, v) \in S^k\mathbf{R}^{m*} \otimes \mathbf{R}^n$  for  $k = 0, 1$  are determined by the contractions  $\langle \psi_{\Gamma, \nabla}^0(\rho, v), u \rangle$ ,  $\langle \psi_{\Gamma, \nabla}^1(\rho, v), w \otimes u \rangle$  for all  $v \in T_0\mathbf{R}^m \cong \mathbf{R}^m$ ,  $u \in \mathbf{R}^{n*}$ ,  $w \in \mathbf{R}^m$  and all  $\Gamma, \nabla$  in question.

Using the polarization formula from linear algebra, we have that every symmetric bilinear form on a vector space is uniquely determined by the corresponding quadratic form. Therefore, for  $k = 2$  the values  $\psi_{\Gamma, \nabla}^2(\rho, v)$  are determined by the contractions  $\langle \psi_{\Gamma, \nabla}^2(\rho, v), (w \odot w) \otimes u \rangle$  for all  $v, u, w, \Gamma, \nabla$  as above, where  $\odot$  denotes the symmetric tensor product. Then by the density argument and  $m \geq 2$ , we can assume that  $v$  and  $w$  are linearly independent and  $u \neq 0$ .

Using the  $GL(m) \times GL(n)$ -invariance of  $\Delta_D$  and Proposition 1, we can assume  $v = e_1$ ,  $w = e_2$ ,  $u = E^1$ , where  $(e_i)$  is the standard basis in  $\mathbf{R}^m$ ,  $(E_p)$  is the standard basis in  $\mathbf{R}^n$  and  $(E^p)$  is the dual basis in  $\mathbf{R}^{n*}$ . So we get that the operator  $\Delta_D$  is uniquely determined by the values  $\langle \psi_{\Gamma, \nabla}^0(\rho, \frac{\partial}{\partial x^1}|_0), E^1 \rangle$ ,  $\langle \psi_{\Gamma, \nabla}^1(\rho, \frac{\partial}{\partial x^1}|_0), e_2 \otimes E^1 \rangle$  and  $\langle \psi_{\Gamma, \nabla}^2(\rho, \frac{\partial}{\partial x^1}|_0), (e_2 \odot e_2) \otimes E^1 \rangle$ . In other words,  $\Delta_D$  is uniquely determined by the values

$$(14) \quad \begin{aligned} & \left\langle Y_{|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \right\rangle \right\rangle \in \mathbf{R} \\ & \left\langle Y_{2|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \right\rangle \right\rangle \in \mathbf{R} \\ & \left\langle Y_{22|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \right\rangle \right\rangle \in \mathbf{R} \end{aligned}$$

for all  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$ , all general connections  $\Gamma$  on  $\mathbf{R}^{m,n}$  and all torsion free classical linear connections  $\nabla$  on  $\mathbf{R}^m$  such that  $\psi = id_{\mathbf{R}^{m,n}}$  is a  $(\Gamma, \nabla, (0, 0), 3)$ -quasi-normal fibred coordinate system on  $\mathbf{R}^{m,n}$  over  $\underline{\psi} = id_{\mathbf{R}^m}$ .

Consider locally defined  $\mathcal{FM}_{m,n}$ -maps  $\psi_2: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$ ,  $\psi_3: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  given by

$$\begin{aligned} \psi_2(x, y) &= (x, y_1 + (y_1)^2, y_2, \dots, y_n) \\ \psi_3(x, y) &= (x, y_1 + (y_1)^3, y_2, \dots, y_n) \end{aligned}$$

for  $x \in \mathbf{R}^n$  and  $y = (y_1, y_2, \dots, y_n) \in \mathbf{R}^n$ . They preserve  $\frac{\partial}{\partial x^1}|_0$  and can be written in the form  $\psi_a(x, y) = (id_{\mathbf{R}^m}(x), H_a(y))$ , where  $H_a(y) = (y_1 + (y_1)^a, y_2, \dots, y_n)$  and  $a = 2, 3$ . So  $\psi_a = id_{\mathbf{R}^m} \times H_a$  for  $H_a: \mathbf{R}^n \rightarrow \mathbf{R}^n$  being a diffeomorphism preserving 0. Hence by Proposition 1 these  $\mathcal{FM}_{m,n}$ -maps  $\psi_a: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  for  $a = 2, 3$  transform quasi-normal fibred coordinate systems into quasi-normal ones. Using the invariance of  $\Delta_D$  with respect to  $\psi_a: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  for  $a = 2, 3$  and the density argument, we show that the values  $\langle Y_{2|\rho}^1, \langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \rangle \rangle$  and  $\langle Y_{|\rho}^1, \langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \rangle \rangle$

for all  $\Gamma \in \text{Con}(\mathbf{R}^{m,n})$ ,  $\nabla \in Q_\tau(\mathbf{R}^m)$ ,  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$  are determined by the values  $\langle Y_{22|_0}^1, \langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \rangle \rangle$  for all  $\Gamma, \nabla, \rho$  as above.

Using the action of the group  $G_{m,n}^3$  on  $S_0$  for  $a = 2$ , we obtain  $\bar{y}_{22}^1 = y_{22}^1 + 2y^1 y_{22}^1 + 2(y_2^1)^2$  and then

$$(15) \quad \bar{Y}_{22}^1 = d\bar{y}_{22}^1 = Y_{22}^1 + 4y_2^1 Y_2^1 + 2y_{22}^1 Y^1 + 2y^1 Y_{22}^1 = Y_{22}^1 + 4y_2^1 Y_2^1 + 2y_{22}^1 Y^1$$

over  $(0, 0) \in \mathbf{R}^{m,n}$  (i.e. for  $y^1 = 0$ ). Similarly, for  $a = 3$  we get  $\tilde{y}_{22}^1 = y_{22}^1 + 3(y^1)^2 y_{22}^1 + 6y^1 (y_2^1)^2$  and then

$$(16) \quad \begin{aligned} \tilde{Y}_{22}^1 &= d\tilde{y}_{22}^1 = Y_{22}^1 + 6(y_2^1)^2 Y^1 + 6y^1 y_{22}^1 Y^1 + 3(y^1)^2 Y_{22}^1 + 12y^1 y_2^1 Y_2^1 \\ &= Y_{22}^1 + 6(y_2^1)^2 Y^1 \end{aligned}$$

over  $(0, 0) \in \mathbf{R}^{m,n}$ .

By formula (16) for  $y_2^1(\rho) \neq 0$ , we have

$$(17) \quad Y^1 = \frac{\tilde{Y}_{22}^1 - Y_{22}^1}{6(y_2^1)^2}$$

and consequently the values  $\langle Y_{|_0}^1, \langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \rangle \rangle$  for all  $\Gamma \in \text{Con}(\mathbf{R}^{m,n})$ ,  $\nabla \in Q_\tau(\mathbf{R}^m)$ ,  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$  are determined by the values  $\langle Y_{22|_0}^1, \langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \rangle \rangle$  for all  $\Gamma, \nabla, \rho$  as above.

Then analogously from (15) and (17), we see that

$$Y_2^1 = \frac{(\bar{Y}_{22}^1 - Y_{22}^1) \cdot 3(y_2^1)^2 - y_{22}^1 (\tilde{Y}_{22}^1 - Y_{22}^1)}{12(y_2^1)^3}$$

and therefore, the values  $\langle Y_{2|_0}^1, \langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \rangle \rangle$  for all  $\Gamma \in \text{Con}(\mathbf{R}^{m,n})$ ,  $\nabla \in Q_\tau(\mathbf{R}^m)$ ,  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$  are determined by the values  $\langle Y_{22|_0}^1, \langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \rangle \rangle$  for all  $\Gamma, \nabla, \rho$  as above.

Summing up, we obtain that the operator  $\Delta_D$  is uniquely determined by the values

$$(18) \quad \left\langle Y_{22|_0}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1}|_0 \right\rangle \right\rangle \in \mathbf{R}$$

for all general connections  $\Gamma$  on  $\mathbf{R}^{m,n}$  such that

$$(19) \quad \begin{aligned} j_{(0,0)}^2 \Gamma &= j_{(0,0)}^2 \left( \Gamma_0 + \sum_{i,j,k=1}^m \sum_{p=1}^n a_{kij}^p x^k x^i dx^j \otimes \frac{\partial}{\partial y^p} \right. \\ &\quad \left. + \sum_{i,j=1}^m \sum_{p,q=1}^n b_{qij}^p y^q x^i dx^j \otimes \frac{\partial}{\partial y^p} + \sum_{i,j=1}^m \sum_{p=1}^n c_{ij}^p x^i dx^j \otimes \frac{\partial}{\partial y^p} \right) \end{aligned}$$

for unique real numbers  $a_{kij}^p, b_{qij}^p$  and  $c_{ij}^p$  satisfying (2) and all torsion free classical linear connections  $\nabla$  such that the identity map  $id_{\mathbf{R}^m}$  is a  $\nabla$ -normal coordinate system with center zero (then  $j_0^1(\nabla) = j_0^1((\sum_{k=1}^m \nabla_{ij;k}^l x^k)_{i,j,l=1}^m)$ )

for some  $\nabla_{ij;k}^l = \nabla_{ji;k}^l \in \mathbf{R}$  satisfying some “classical” conditions) and all  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$  of the form

$$(20) \quad \rho = j_0^2 \left( \left( \sum_{i=1}^m g_i^p x^i + \sum_{i,j=1}^m h_{ij}^p x^i x^j \right)_{p=1}^n \right)$$

for real numbers  $g_i^p, h_{ij}^p = h_{ji}^p$ . So, it is sufficient to study the values (18) for  $\Gamma, \nabla, \rho$  as above.

Equivalently, in terms of  $G_{m,n}^3$ -invariant maps between the standard fibres we obtain that values of functions  $f_1^1$  and  $f_{2;1}^1$  are determined by values of functions  $f_{22;1}^1$ . So we will study the values

$$(21) \quad \begin{aligned} f_{22;1}^1(\Gamma_{kij}^p = a_{kij}^p, \Gamma_{qij}^p = b_{qij}^p, \Gamma_{ij}^p = c_{ij}^p, \nabla_{ijk}^l = \nabla_{ij;k}^l, \\ y_i^p = g_i^p, y_{ij}^p = h_{ij}^p). \end{aligned}$$

The invariance of  $f_{ij;k}^p$  with respect to the homotheties

$$\begin{aligned} \tilde{a}_j^i = t\delta_j^i, \tilde{a}_q^p = t\delta_q^p, a_i^p = 0, a_{qr}^p = 0, a_{qi}^p = 0, \tilde{a}_{ij}^k = 0, a_{ij}^p = 0, \\ a_{qri}^p = 0, a_{qrs}^p = 0, a_{qij}^p = 0, a_{ijk}^p = 0, \tilde{a}_{ijk}^l = 0, \end{aligned}$$

yields

$$t^2 f_{ij;k}^p = f_{ij;k}^p (t^2 a_{kij}^p, t^2 b_{qij}^p, t c_{ij}^p, t^2 \nabla_{ij;k}^l, g_i^p, t h_{ij}^p).$$

Then the homogeneous function theorem implies that  $f_{ij;k}^p$  is linear in  $a_{kij}^p, b_{qij}^p, \nabla_{ij;k}^l$ , bilinear in  $c_{ij}^p, h_{ij}^p$ , quadratic in  $c_{ij}^p$  and  $h_{ij}^p$ . In other words  $f_{ij;k}^p$  is the linear combination of monomials

$$(22) \quad a_{kij}^p, b_{qij}^p, \nabla_{ij;k}^l, c_{ij}^p h_{i_1 j_1}^{p_1}, c_{ij}^p c_{i_1 j_1}^{p_1}, h_{ij}^p h_{i_1 j_1}^{p_1}$$

with the coefficients being smooth functions in the coefficients  $g_i^p$  of  $\rho$ .

Then using the invariance of  $f_{ij;k}^p$  with respect to the homotheties

$$\begin{aligned} \tilde{a}_j^i = \delta_j^i, a_q^p = t\delta_q^p, a_i^p = 0, a_{qr}^p = 0, a_{qi}^p = 0, \tilde{a}_{ij}^k = 0, a_{ij}^p = 0, \\ a_{qri}^p = 0, a_{qrs}^p = 0, a_{qij}^p = 0, a_{ijk}^p = 0, \tilde{a}_{ijk}^l = 0, \end{aligned}$$

for  $t > 0$  and the homogeneous function theorem, we observe that the coefficients on  $a_{kij}^p$  are constant, the coefficients on  $b_{qij}^p$  and  $\nabla_{ij;k}^l$  are linear and the coefficients on other terms from (22) are zero.

Then using the invariance of  $f_{ij;k}^p$  with respect to the  $\mathcal{FM}_{m,n}$ -maps  $\psi_{t,\tau}: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  given by  $\psi_{t,\tau}(x, y) = (t^1 x^1, \dots, t^m x^m, \tau^1 y^1, \dots, \tau^n y^n)$

for  $t^i > 0$ ,  $i = 1, \dots, m$  and  $\tau^p > 0$ ,  $p = 1, \dots, n$  we deduce that

$$\begin{aligned} f_{22;1}^1 &= (\alpha_1 a_{122}^1 + \alpha_2 a_{212}^1 + \alpha_3 a_{221}^1) \\ &+ \left( \sum_{q=1}^n \beta_{q12} b_{q12}^1 g_2^q + \sum_{q=1}^n \beta_{q21} b_{q21}^1 g_2^q + \sum_{q=1}^n \beta_{q22} b_{q22}^1 g_1^q \right) \\ &+ \left( \sum_{q=1}^n \gamma_{q12} b_{q12}^q g_2^1 + \sum_{q=1}^n \gamma_{q21} b_{q21}^q g_2^1 + \sum_{q=1}^n \gamma_{q22} b_{q22}^q g_1^1 \right) + g((g_l^1), (\nabla_{ij;k}^l)) \end{aligned}$$

for some uniquely determined real numbers  $\alpha_1, \alpha_2, \alpha_3, \beta_{q12}, \beta_{q21}, \beta_{q22}, \gamma_{q12}, \gamma_{q21}, \gamma_{q22}$  and some uniquely determined bilinear function  $g$ .

Now because of conditions (2) we have

$$\begin{aligned} f_{22;1}^1 &= a_{122}^1(\alpha_1 + \alpha_2 - 2\alpha_3) + \sum_{q=1}^n (\beta_{q12} - \beta_{q21}) b_{q12}^1 g_2^q \\ &+ \sum_{q=1}^n (\gamma_{q12} - \gamma_{q21}) b_{q12}^q g_2^1 + g((g_l^1), (\nabla_{ij;k}^l)) \\ &= \alpha a_{122}^1 + \sum_{q=1}^n \beta_q b_{q12}^1 g_2^q + \sum_{q=1}^n \gamma_q b_{q12}^q g_2^1 + g((g_l^1), (\nabla_{ij;k}^l)), \end{aligned}$$

where  $\alpha = \alpha_1 + \alpha_2 - 2\alpha_3$ ,  $\beta_q = \beta_{q12} - \beta_{q21}$ ,  $\gamma_q = \gamma_{q12} - \gamma_{q21}$  for  $q = 1, \dots, n$ . Further evaluations give

$$\begin{aligned} f_{22;1}^1 &= \alpha a_{122}^1 + (\beta_1 + \gamma_1) b_{112}^1 g_2^1 + \sum_{q=2}^n \beta_q b_{q12}^1 g_2^q \\ &+ \sum_{q=2}^n \gamma_q b_{q12}^q g_2^1 + g((g_l^1), (\nabla_{ij;k}^l)) \\ &= \alpha a_{122}^1 + \beta b_{112}^1 g_2^1 + \sum_{q=2}^n \beta_q b_{q12}^1 g_2^q + \sum_{q=2}^n \gamma_q b_{q12}^q g_2^1 + g((g_l^1), (\nabla_{ij;k}^l)), \end{aligned}$$

where  $\beta = \beta_1 + \gamma_1$ . In other words,

$$\begin{aligned} \left\langle Y_{22|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1} | 0 \right\rangle \right\rangle &= \alpha a_{122}^1 + \beta b_{112}^1 g_2^1 + \sum_{q=2}^n \beta_q b_{q12}^1 g_2^q \\ (23) \quad &+ \sum_{q=2}^n \gamma_q b_{q12}^q g_2^1 + g((g_l^1), (\nabla_{ij;k}^l)), \end{aligned}$$

for some uniquely determined real numbers  $\alpha, \beta, \beta_q, \gamma_q$  and some uniquely determined bilinear function  $g$ , where  $j_{(0,0)}^2 \Gamma$  is of the form (19) with the coefficients  $a_{kij}^p, b_{qij}^p$  and  $c_{ij}^p$  satisfying (2),  $j_0^1(\nabla) = j_0^1((\sum_{k=1}^m \nabla_{ij;k}^l x^k)_{i,j,l=1}^m)$

for some  $\nabla_{ij;k}^l = \nabla_{j;k}^l \in \mathbf{R}$  satisfying some “classical” conditions and  $\rho$  is of the form (20) with  $g_i^p, h_{i;j}^p = h_{ji}^p$ .

From (23) it follows that  $\Delta_D$  is determined by the real number  $\alpha$ , the bilinear map  $g$  and the values

$$\begin{aligned}
 (24) \quad & \Delta_D \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1} \right. \\
 & \left. + \sum_{p,q=1}^n b_{q12}^p y^q (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^p}, \nabla^0 \right) (\rho) \\
 & = \Delta_D \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \left( \frac{\partial}{\partial y^1} + \sum_{p,q=1}^n b_{q12}^p y^q \frac{\partial}{\partial y^p} \right), \nabla^0 \right) (\rho)
 \end{aligned}$$

for all  $b_{q12}^p \in \mathbf{R}$  and all  $\rho \in (J^2 \mathbf{R}^{m,n})_{(0,0)}$ , where  $\nabla^0$  is the usual flat torsion free classical linear connection on  $\mathbf{R}^m$ .

Considering the invariance of  $\Delta_D$  with respect to the maps  $id_{\mathbf{R}^m} \times H$  for diffeomorphisms  $H: \mathbf{R}^n \rightarrow \mathbf{R}^n$  preserving 0, we get that  $\sum_{p,q=1}^n b_{q12}^p y^q \frac{\partial}{\partial y^p}$  is near 0 equal to zero modulo some diffeomorphism  $H: \mathbf{R}^n \rightarrow \mathbf{R}^n$  preserving 0. Hence we have that  $\Delta_D$  is determined by the real number  $\alpha$ , the bilinear map  $g$  and the values

$$(25) \quad \Delta_D \left( \Gamma_0 + a(x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (\rho)$$

for all  $a \in \mathbf{R}$  and all  $\rho \in (J^2 \mathbf{R}^{m,n})_{(0,0)}$ .

Next using the invariance of  $\Delta_D$  with respect to the homotheties

$$\begin{aligned}
 \tilde{a}_j^i &= \delta_j^i, \quad a_q^p = t \delta_q^p, \quad a_i^p = 0, \quad a_{qr}^p = 0, \quad a_{qi}^p = 0, \quad \tilde{a}_{ij}^k = 0, \quad a_{ij}^p = 0, \\
 a_{qri}^p &= 0, \quad a_{qrs}^p = 0, \quad a_{qij}^p = 0, \quad a_{ijk}^p = 0, \quad \tilde{a}_{ijk}^l = 0,
 \end{aligned}$$

from the homogeneous function theorem, it follows that (25) depends linearly in  $(a, \rho)$ . This implies that  $\Delta_D$  is determined by the real number  $\alpha$ , the bilinear map  $g$  and the values

$$\Delta_D \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0) \quad \text{and} \quad \Delta_D(\Gamma_0, \nabla^0)(\rho)$$

for all  $\rho \in (J^2 \mathbf{R}^{m,n})_{(0,0)}$ .

Now the values  $\Delta_D(\Gamma_0, \nabla^0)(\rho)$  are determined by the values  $\langle \Delta_D(\Gamma_0, \nabla^0)(\rho), v \rangle \in V_\rho J^2 \mathbf{R}^{m,n} \cong_\rho J_0^2 \mathbf{R}^{m,n} \cong \oplus_{k=0}^2 S^k \mathbf{R}^{m*} \otimes \mathbf{R}^n$  for all  $\rho \in (J^2 \mathbf{R}^{m,n})_{(0,0)}$ ,  $v \in T_0 \mathbf{R}^m$  such that  $\psi = id_{\mathbf{R}^{m,n}}$  is a  $(\Gamma_0, \nabla^0, (0,0), 3)$ -quasi-normal fibred coordinate system on  $\mathbf{R}^{m,n}$  over  $\underline{\psi} = id_{\mathbf{R}^m}$ . Since the  $\mathcal{FM}_{m,n}$ -maps of the form  $B \times H$  (in question) preserve the trivial general connection  $\Gamma_0$  and the flat torsion free classical linear connection  $\nabla^0$  then we deduce that the values  $\Delta_D(\Gamma_0, \nabla^0)(\rho)$  are determined by the values

$\langle Y_{22|_0}^1, \langle \Delta_D(\Gamma_0, \nabla^0)(\rho), \frac{\partial}{\partial x^1} |_0 \rangle \rangle$ . But using the formula (23), we see that the last values are equal to zero. Therefore,

$$(26) \quad \Delta_D(\Gamma_0, \nabla^0)(\rho) = 0$$

for any  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$ . This gives that  $\Delta_D$  is determined by the real number  $\alpha$ , the bilinear map  $g$  and the values

$$(27) \quad \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0).$$

The value (27) is determined by the evaluations

$$(28) \quad \begin{aligned} & \left\langle Y_{|j_0^2 0}^p, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^k} |_0 \right\rangle \right\rangle \\ & \left\langle Y_{i|j_0^2 0}^p, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^k} |_0 \right\rangle \right\rangle \\ & \left\langle Y_{ij|j_0^2 0}^p, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^k} |_0 \right\rangle \right\rangle \end{aligned}$$

for all  $p = 1, \dots, n$  and all  $i, j, k = 1, \dots, m$ .

Since (25) depends linearly on  $a$ , using the invariance of  $\Delta_D$  with respect to the homotheties

$$\begin{aligned} \tilde{a}_j^i &= \delta_j^i, \quad \tilde{a}_q^p = t\delta_q^p, \quad a_i^p = 0, \quad a_{qr}^p = 0, \quad a_{qi}^p = 0, \quad \tilde{a}_{ij}^k = 0, \quad a_{ij}^p = 0, \\ a_{qri}^p &= 0, \quad a_{qrs}^p = 0, \quad a_{qij}^p = 0, \quad a_{ijk}^p = 0, \quad \tilde{a}_{ijk}^l = 0, \end{aligned}$$

we see that

$$\begin{aligned} & \left\langle Y_{|j_0^2 0}^p, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^k} |_0 \right\rangle \right\rangle = 0, \\ & \left\langle Y_{ij|j_0^2 0}^p, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^k} |_0 \right\rangle \right\rangle = 0. \end{aligned}$$

Therefore,  $\Delta_D$  is determined by the evaluations

$$(29) \quad \left\langle Y_{i|j_0^2 0}^p, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^k} |_0 \right\rangle \right\rangle.$$

Then using the invariance of  $\Delta_D$  with respect to  $a_t: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  by  $a_t(x, y) = (x, ty_1, y_2, \dots, y_n)$  for  $t > 0$ , we may assume  $p = 1$ , i.e.  $\Delta_D$  is determined by the evaluations

$$(30) \quad \left\langle Y_{i|j_0^2 0}^1, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^k} |_0 \right\rangle \right\rangle.$$

Then using the invariance of  $\Delta_D$  with respect to  $b_t: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  by  $b_t(x, y) = (t_1 x_1, \dots, t_m x_m, y_1, \dots, y_n)$ , we see that the values (30) are all zero except the values

$$(31) \quad \left\langle Y_{1|j_0^2 0}^1, \left\langle \Delta_D\left(\Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0\right)(j_0^2 0), \frac{\partial}{\partial x^2} |_0 \right\rangle \right\rangle$$

and

$$(32) \quad \left\langle Y_{2|j_0^2}^1, \left\langle \Delta_D \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle \right\rangle.$$

Because of the invariance of  $\Delta_D$  with respect to exchanging  $x^1$  and  $x^2$  (i.e. with respect to the map  $c: \mathbf{R}^{m,n} \rightarrow \mathbf{R}^{m,n}$  given by  $c(x^1, x^2, \dots, x_m, y) = (x^2, x^1, \dots, x_m, y)$ ), we get

$$\begin{aligned} & \left\langle Y_{1|j_0^2}^1, \left\langle \Delta_D \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0), \frac{\partial}{\partial x^2} \Big|_0 \right\rangle \right\rangle \\ &= - \left\langle Y_{2|j_0^2}^1, \left\langle \Delta_D \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle \right\rangle. \end{aligned}$$

Consequently, the vector space of all possible values (27) is of dimension  $\leq 1$ . So, the vector space of all possible  $\Delta_D$  is of dimension  $\leq 2 + K$ , where  $K$  is the dimension of the vector space of all possible  $g$ .

If  $D = \mathcal{J}_{[i]}^2$  for  $i = 1, 2$  is as in Example 3, then we have

$$\begin{aligned} & \left\langle \Delta_{\mathcal{J}_{[1]}^2} \left( \Gamma_0 + (x^1 x^2 dx^2 - (x^2)^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle = 0, \\ & \left\langle \Delta_{\mathcal{J}_{[1]}^2} \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle \\ & \quad = \mathcal{J}^2 \left( x^2 \frac{\partial}{\partial y^1} \right) (j_0^2 0), \\ & \left\langle \Delta_{\mathcal{J}_{[2]}^2} \left( \Gamma_0 + (x^1 x^2 dx^2 - (x^2)^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle \\ & \quad = \mathcal{J}^2 \left( (x^2)^2 \frac{\partial}{\partial y^1} \right) (j_0^2 0), \\ & \left\langle \Delta_{\mathcal{J}_{[2]}^2} \left( \Gamma_0 + (x^1 dx^2 - x^2 dx^1) \otimes \frac{\partial}{\partial y^1}, \nabla^0 \right) (j_0^2 0), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle = 0, \\ & \quad \Delta_{\mathcal{J}_{[i]}^2}(\Gamma_0, \nabla)(\rho) = 0 \quad \text{for } i = 1, 2 \end{aligned}$$

for any  $\rho \in (J^2 \mathbf{R}^{m,n})_{(0,0)}$  and any torsion free classical linear connection  $\nabla \in Q_\tau(\mathbf{R}^m)$  such that  $id_{\mathbf{R}^m}$  is a  $\nabla$ -normal coordinate system with center 0. By the flow argument we see that

$$\begin{aligned} \mathcal{J}^2 \left( (x^2)^2 \frac{\partial}{\partial y^1} \right) (j_0^2 0) &\cong j_0^2((x^2)^2) \mathcal{J}^2 \left( \frac{\partial}{\partial y^1} \right) (j_0^2 0), \\ \mathcal{J}^2 \left( x^2 \frac{\partial}{\partial y^1} \right) (j_0^2 0) &\cong j_0^2(x^2) \mathcal{J}^2 \left( \frac{\partial}{\partial y^1} \right) (j_0^2 0), \end{aligned}$$

and then they are linearly independent.

Using the dimension argument and the formula (23), we deduce that there exist unique real numbers  $t_1$  and  $t_2$  and an  $\mathcal{FM}_{m,n}$ -natural operator

$D_1$  such that

$$(33) \quad D = (1 - t_1 - t_2)D_1 + t_1\mathcal{J}_{[1]}^2 + t_2\mathcal{J}_{[2]}^2$$

(the affine combination) and

$$(34) \quad \Delta_{D_1}(\Gamma, \nabla^0)(\rho) = 0$$

for all  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$  and all general connections  $\Gamma$  on  $\mathbf{R}^{m,n}$  such that the identity map  $\psi = id_{\mathbf{R}^{m,n}}$  is a  $(\Gamma, \nabla^0, (0, 0), 3)$ -quasi-normal fibred coordinate system on  $\mathbf{R}^{m,n}$ . The operator  $D_1$  is uniquely determined if  $t_1 + t_2 \neq 1$ .

It remains to show that  $D_1$  is of the form

$$(35) \quad D_1 = \mathcal{J}_{(A)}^2$$

for a uniquely determined  $\mathcal{M}f_m$ -natural operator  $A$  transforming torsion free classical linear connections  $\nabla$  on  $m$ -manifolds  $M$  into second order linear connections  $A(\nabla): TM \rightarrow J^2TM$  on  $M$ , where  $\mathcal{J}_{(A)}^2$  is as in Example 1.

We construct  $A$  in the following way. Given a torsion free classical linear connection  $\nabla$  on a  $m$ -manifold  $M$  we define a tensor field  $\tilde{A}(\nabla): M \rightarrow T^*M \otimes S^2T^*M \otimes TM$  on  $M$  by

$$(36) \quad \langle \tilde{A}(\nabla)|_x, \omega \rangle = pr_1 \circ \Delta_{D_1}(\Gamma_M, \nabla)(j_x^2(f, 0, \dots, 0)) \in T_x^*M \otimes S^2T_x^*M,$$

where  $\omega = d_x f \in T_x^*M$ ,  $f: M \rightarrow \mathbf{R}$ ,  $f(x) = 0$ ,  $\Gamma_M$  is the trivial general connection on the trivial bundle  $M \times \mathbf{R}^n \rightarrow M$  and

$$pr_1: T^*M \otimes S^2T^*M \otimes V(M \times \mathbf{R}^n) = T^*M \otimes S^2T^*M \otimes \mathbf{R}^n \rightarrow T^*M \otimes S^2T^*M$$

is the projection onto the first factor.

The definition (36) is correct because

$$\begin{aligned} \Delta_{D_1}(\Gamma_M, \nabla)(j_x^2(f, 0, \dots, 0)) &\in T^*M \otimes S^2T^*M \otimes V(M \times \mathbf{R}^n) \\ &\subset T^*M \otimes VJ^2(M \times \mathbf{R}^n) \end{aligned}$$

as  $\Delta_{D_1}(\Gamma_M, \nabla)(j_x^2(f, 0, \dots, 0))$  projects onto zero by

$$id_{T^*M} \otimes V\pi_1^2: T^*M \otimes VJ^2(M \times \mathbf{R}^n) \rightarrow T^*M \otimes VJ^1(M \times \mathbf{R}^n),$$

where  $\pi_1^2: J^2Y \rightarrow J^1Y$  is the jet projection. Indeed, in order to observe that  $\Delta_{D_1}(\Gamma_M, \nabla)(j_x^2(f, 0, \dots, 0))$  projects onto zero, we can assume that  $M = \mathbf{R}^m$ ,  $x = 0$  and  $\psi = id_{\mathbf{R}^{m,n}}$  is a  $(\Gamma_0, \nabla, (0, 0), 3)$ -quasi-normal fibred coordinate system on  $\mathbf{R}^{m,n}$  because of the  $\mathcal{F}\mathcal{M}_{m,n}$ -invariance of  $\Delta_{D_1}$ . From (26) for  $\Delta_{D_1}$  instead of  $\Delta_D$  we have  $\Delta_{D_1}(\Gamma_0, \nabla^0)(j_0^2(f, 0, \dots, 0)) = 0$ . Then using the invariance of  $\Delta_{D_1}$  with respect to the homotheties and applying the homogeneous function theorem, we complete the observation.

Using the invariance of  $\Delta_{D_1}$  with respect to the fiber homotheties  $id_M \times tid_{\mathbf{R}^n}$  and applying the homogeneous function theorem, we see that the value (36) depends linearly on  $\omega$ . Hence  $\tilde{A}$  is really a tensor field.

Let

$$(37) \quad A(\nabla) := A_2^{exp}(\nabla) + \tilde{A}(\nabla): TM \rightarrow J^2TM$$

be the second order connection corresponding to  $\tilde{A}$ . So, we have constructed an  $\mathcal{M}f_m$ -natural operator  $A$  transforming torsion free classical linear connections  $\nabla$  on  $m$ -manifolds  $M$  into second order linear connections  $A(\nabla): TM \rightarrow J^2TM$  on  $M$ .

We prove (35) as follows. Using the invariance of  $A - A_2^{exp}$  with respect to the homotheties and applying the homogeneous function theorem, we see that  $A(\nabla^0) - A_2^{exp}(\nabla^0)$  is the zero tensor field of type  $T^* \otimes S^2T^* \otimes T$ . Therefore, we obtain (34) for  $\Delta_{\mathcal{J}(A)}$  instead of  $\Delta_{D_1}$ . Then using the condition (34), we get

$$(38) \quad \left\langle Y_{22|\rho}^1, \left\langle \Delta_{D_1}(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle \right\rangle = \left\langle Y_{22|\rho}^1, \left\langle \Delta_{D_{\mathcal{J}(A)}}(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1} \Big|_0 \right\rangle \right\rangle = g((g^1), (\nabla^l_{ij;k}))$$

for any  $\rho \in (J^2\mathbf{R}^{m,n})_{(0,0)}$ , any general connection  $\Gamma$  on  $\mathbf{R}^{m,n}$  and any torsion free classical linear connection  $\nabla$  on  $\mathbf{R}^m$  such that the identity map  $\psi = id_{\mathbf{R}^{m,n}}$  is a  $(\Gamma, \nabla, (0, 0), 3)$ -quasi-normal coordinate system on  $\mathbf{R}^{m,n}$ , where

$$j_{(0,0)}^2\Gamma = j_{(0,0)}^2\left(\Gamma_0 + \sum_{i,j,k=1}^m \sum_{p=1}^n a_{kij}^p x^k x^i dx^j \otimes \frac{\partial}{\partial y^p} + \sum_{i,j=1}^m \sum_{p,q=1}^n b_{qij}^p y^q x^i dx^j \otimes \frac{\partial}{\partial y^p} + \sum_{i,j=1}^m \sum_{p=1}^n c_{ij}^p x^i dx^j \otimes \frac{\partial}{\partial y^p}\right)$$

with coefficients  $a_{kij}^p, b_{qij}^p$  and  $c_{ij}^p$  satisfying (2),

$$j_0^1(\nabla) = j_0^1\left(\left(\sum_{k=1}^m \nabla^l_{ij;k} x^k\right)_{i,j,l=1}^m\right)$$

for  $\nabla^l_{ij;k} = \nabla^l_{ji;k} \in \mathbf{R}$  satisfying some ‘‘classical’’ conditions,  $\rho$  is of the form

$$\rho = j_0^2\left(\left(\sum_{i=1}^m g_i^p x^i + \sum_{i,j=1}^m h_{ij}^p x^i x^j\right)_{p=1}^n\right)$$

for real numbers  $g_i^p, h_{ij}^p = h_{ji}^p$  and  $g$  is the bilinear map as in (23). Then we have (35) because any  $\Delta_D$  (and then any  $D$ ) is determined by the values (18).

If  $D_1 = \mathcal{J}_{(A_1)}^2$  for another  $\mathcal{M}f_m$ -natural operator  $A_1$  (of the type as the one of  $A$ ), then

$$(39) \quad \langle \tilde{A}(\nabla)|_x, \omega \rangle = \langle \tilde{A}_1(\nabla)|_x, \omega \rangle$$

for any torsion free classical linear connection  $\nabla$  on  $M$  and any  $\omega \in T_x^*M, x \in M$ , where  $\tilde{A}_1(\nabla) = A_1(\nabla) - A_2^{exp}(\nabla): M \rightarrow T^*M \otimes S^2T^*M \otimes TM$  is the tensor field corresponding to  $A_1(\nabla): TM \rightarrow J^2TM$ .

Because of  $\mathcal{M}f_m$ -invariance it is sufficient to show (39) in the case  $M = \mathbf{R}^m, x = 0$  and the identity map  $\psi = id_{\mathbf{R}_{m,n}}$  is a  $(\Gamma, \nabla, (0, 0), 3)$ -quasi-normal fibred coordinate system on  $\mathbf{R}_{m,n}$ . It is not difficult. So,  $A_1 = A$ , i.e.  $A$  satisfying (35) is uniquely determined. The proof of Theorem 1 for  $m \geq 2$  is complete.

If  $m = 1$ , we proceed similarly as in the case  $m \geq 2$ . Therefore,  $\Delta_D$  is uniquely determined by the values

$$\begin{aligned} \left\langle Y_{|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1} |_0 \right\rangle \right\rangle &\in \mathbf{R} \\ \left\langle Y_{1|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1} |_0 \right\rangle \right\rangle &\in \mathbf{R} \\ \left\langle Y_{11|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1} |_0 \right\rangle \right\rangle &\in \mathbf{R} \end{aligned}$$

for all  $\rho \in (J^2\mathbf{R}^{1,n})_{(0,0)}$ , all general connections  $\Gamma$  on  $\mathbf{R}^{1,n}$  and all torsion free classical linear connections  $\nabla$  on  $\mathbf{R}$  such that  $\psi = id_{\mathbf{R}^{1,n}}$  is a  $(\Gamma, \nabla, (0, 0), 3)$ -quasi-normal fibred coordinate system on  $\mathbf{R}^{1,n}$  over  $\underline{\psi} = id_{\mathbf{R}}$ . Then the operator  $\Delta_D$  is uniquely determined by the values

$$\left\langle Y_{11|\rho}^1, \left\langle \Delta_D(\Gamma, \nabla)(\rho), \frac{\partial}{\partial x^1} |_0 \right\rangle \right\rangle \in \mathbf{R}.$$

If the identity map  $\psi = id_{\mathbf{R}^{1,n}}$  is a  $(\Gamma, \nabla, (0, 0), 3)$ -quasi-normal fibred coordinate system, then  $j_{(0,0)}^2\Gamma = j_{(0,0)}^2(\Gamma_0)$  and  $j_0^1(\nabla) = j_0^1(\nabla^0)$  (as the curvature of  $\nabla$  is zero). Consequently,  $\Delta_D$  is determined by the values

$$(40) \quad \left\langle Y_{11}^1, \left\langle \Delta_D(\Gamma_0, \nabla^0)(\rho), \frac{\partial}{\partial x^1} |_0 \right\rangle \right\rangle \in \mathbf{R}$$

for all  $\rho \in J_0^2(\mathbf{R}, \mathbf{R}^n)_0$ . But the values (40) are zero because of the similar arguments as in the proof of formula (23).

The proof of Theorem 1 is complete.  $\square$
